

Your Journey to Holistic Exposure Management in 12 Weeks

PROGRAM BRIEF

Accelerated risk reduction is closer than you think

Traditional vulnerability management programs struggle to keep pace with an evolving risk landscape. Security teams are overwhelmed by the sheer volume of scanning results and lack the context they need to prioritize findings effectively. Companies invest in dozens of point solutions to understand the security posture of various domains, which leaves them without a single, actionable view of risk across their environment.

Exposure management offers a solution with unified asset data, exposure findings, and threat intelligence across all these siloed security tools. But according to [Enterprise Strategy Group](#), only 26% of organizations use a dedicated threat and exposure management platform. So, what's stopping CISOs and enterprise security teams from investing in a unified approach?

Most have no idea there's a better way, and others fear that deploying such a system could be challenging and complex.

Holistic exposure management is within reach

Zscaler is at the forefront of enabling this new, unified approach. The Zscaler Exposure Management platform is built on the world's first Data Fabric for Security, which aggregates and correlates data from Zscaler systems and 200+ third-party sources to uncover gaps that other solutions miss. Whatever tools you use to measure risk today, you're only 12 weeks away from running a holistic exposure management program. How?

Follow this deployment playbook:
