

Zscaler was founded on a vision that the internet would become the new corporate network as the cloud become the new data center. We predicted that with rapid cloud adoption and increasing workforce mobility, traditional perimeter security approaches would provide inadequate protection for users and data and an increasingly poor user experience. We pioneered a security cloud that represents a fundamental shift in the architectural design and approach to network security.

Our security cloud, which is distributed across more than 100 data center around the world, helps organization accelerate their IT transformation to the cloud. Our customers benefit from the network effect of our growing cloud because once a new threat is detected, it can be blocked for user across our entire customer base with minutes.

Company Mission

Zscaler's mission is to empower organizations to realize the full potential of the cloud and mobility by securely connecting users to applications from any device, anywhere.
