

# Zero Trust 101: From siloes to security everywhere

As employees and apps go remote,  
traditional security is no longer enough.

Here's what's replacing it.

## Work has changed

Today, users, devices and apps are  
connecting from everywhere, not just  
the corporate network.

# 80%

of employees are hybrid  
or remote<sup>1</sup>

# 90%

of apps reside in the cloud<sup>2</sup>

## Traditional security can't keep up

Conventional network-centric architectures  
create fundamental weaknesses.

### Expanded attack surface

Public IPs expose  
firewalls and VPNs

### Lateral movement

Once inside, attackers  
can move freely

### Encrypted blind spots

95% of traffic is encrypted  
and difficult to inspect

### Poor user experience

Backhauling traffic  
causes delays

## The 'trusted network' is no longer trustworthy

Once an attacker is inside your network,  
they can unleash serious damage —  
deploying ransomware, stealing sensitive  
data, and disrupting critical systems.

# 200%

increase in ransomware  
attacks between 2021-24

## Enter a new approach: zero trust

Zero trust is a security framework that  
treats every connection as untrusted until  
proven safe.

### PRINCIPLES OF ZERO TRUST

### No implicit trust

Assume no user, device  
or connection is safe

### Continuous verification

Check every identity,  
device and context

### Minimal exposure

Grant access only to the  
resources users need

### Direct-to-app connectivity

Connect direct to apps,  
not the network

## How it works

In a zero trust architecture, every access  
request is evaluated before access is granted.

### Verify identity

Who are you?

### Identify destination

Where are you going?

### Assess risk

What's the risk?

### Enforce policy

Block, allow, caution?

“Think of zero trust as an intelligent switchboard that  
provides secure any-to-any connectivity in a one-to-one  
fashion, without extending the network to anyone or  
anything. Basically, you're decoupling security and  
connectivity from the network.”

Jacob Serpa, Zscaler

## Zscaler: powering zero trust everywhere

Zscaler's Zero Trust Exchange enforces  
zero trust at scale, securely connecting  
users to apps, services and data,  
without exposing your network.

# 160+

points of presence

# 500B+

requests processed every day

# 4000

threats blocked every second

## Ready to take the next step?

Master the fundamentals of zero trust and start applying it in your  
organisation with our 3-part video series.

#### About Zscaler:

Zscaler (NASDAQ: ZS) accelerates digital transformation so that customers can be more agile, efficient, resilient, and secure. The Zscaler Zero Trust Exchange™ protects thousands of customers from cyberattacks and data loss by securely connecting users, devices, and applications in any location. Distributed across more than 150 data centres globally, the SSE-based Zero Trust Exchange™ is the world's largest in-line cloud security platform. Learn more at [zscaler.com](https://zscaler.com) or follow us on X (Twitter) @zscaler.
